Experiment - 8

Building Anonymous FTP scanner using ftplib module

Aim:

To build an anonymous FTP scanner using Python's ftplib module to detect open ftp sever

Theory:

FTP (file transfer protocol) is a network protocol used to transfer file

Procedure:

1) import ftplib, sockets and concurrent.futures module

2) Define a function a non-ftp-scanner that atempts anonymous ftp login

3) use ftp ftp() with a timeout to connects to a target IP on port 21

4) If login succeeds list the root directory

command / code :-

```
import ftplib, sockets
from concurrent.futures import thread

def anon_ftp_scan(ip):
    try:
        ftp = ftplib.FTP(timeout=3)
        ftp.connect(ip, 21, timeout=3)
        ftp.login('anonymous', 'anon')
        print('[+] {ip} - Anonymous FTP open')
        print('[+] welcome: {ftp.getwelcome()}')
        files = ftp.nlst()
        print('[-] {files[:5]}')
        ftp.quit()
        return True
```

5) print the ip welcome message

6) Handle exception: connections Refused error

7) use thread pool executor to scan multiple IP, concurrently

8) create a list of IP addrest to scan

9) Run the scanner and record the result

10) use ftplib.quit() to close

Result:

The anon FTP scanner was implemented successfully. open FTP, server allowing anon login were identity and directory listing
